The 2185 system is comprised of three LRU drawers including the integrated control drawer. The amplifier sub-drawer boosters employed in this system features multiple high power LDMOS devices that provide wide frequency response, high gain, high peak power capability, and low distortions. Exceptional performance, long-term reliability and high efficiency are achieved by employing advanced broadband RF matching networks and combining techniques, EMI/RFI filters, and all qualified components. Each LRU drawer is constructed within one single 3RU including the integral forced air-cooling fans.

The amplifier system includes a built-in control and monitoring system, with protection functions that preserve maximum output availability. Remote management and diagnostics are via an embedded web server allowing network managed site status and control simply by connecting the unit’s Ethernet port to a LAN. Using a web browser and the unit’s IP address (IPV4) allows ease of access with the benefit of multilevel security. The control system core runs an embedded OS (Linux), has a built-in non-volatile memory for event recording, and factory setup recovery features. The extended memory option allows storage of control parameters and event logs.

- Solid-state class AB design
- Suitable for instantaneous pulse operation.
- Compact Modular design and scalable architecture
- 50 ohm input/output impedance
- Built-in Control, Monitoring and Protection functions
- High reliability and ruggedness

Available Options

2185-001, -00X, -00X

-001 180-260VAC, 1-phase, MIL-STD DC Connector, Rear RF Connectors

Standard Features:

- LCD Control, Ethernet & Serial Comm
- Type-N Female Input & 7/16(DIN) Female Output
- Rear SMA Sample Ports, Forward & Reverse
- BNC Female Blank/Gating Port
- Rack Slides, Handles and Rackmount Bracket
Notes:
The Empower L-Band 10KW, SSPA will consist of 2 x dual deck 3U chassis and one 3U power supply, EIA 19" Standard.
In the Control/Power Supply 3U chassis will host the the 2 way 90° splitter and the Ethernet Switch. We could also build the Detectors inside
the PS and the smart display.
The combiner and dual directional coupler are assembled directly to the rear of the units using blind mate connector. The isolated load
detector can stir the phase adjustment of one of the units to reduce the PA unbalance. The detectors are also located in the power supply
and would be connected to the Smart Display by the I/O interface.
